

Page Template

A Page Template defines the basic format or template for pages. This deliverable is used primarily in web-based applications that require multiple pages to adhere to a single template (for logos, backgrounds, frames, etc.). For web-based applications, each page type should be documented with a Page Template. Use a Page Template to communicate a standard to the design and development teams. To ensure consistent development of web pages of the same type, the media content developers should copy the Page Template, give it a new file name, and then populate the file with media content.

Description

The Page Template is designed by the project team to include the logos, background, frames, etc. as they should look on the standard page layout. Once this layout is created by the team it should be copied and used as the template.
